

# Cycle ball - New development with air core

For several years now, it has become apparent that the supply of balls for cycle ball is increasingly becoming a challenge. With this new development, we therefore want to contribute to a sustainable supply of cycle balls!

We have developed a cycle ball that combines the previous features with new advantages thanks to a completely new design.

After many prototypes and tests, we have advanced the development to the point where the ball can be manufactured in series. It is characterized by the following features:

- Compliant with regulations weight, size and fabric surface
- Playing characteristics corresponding to a traditionally manufactured ball
  - Constant dimensional stability due to the use of an air core
  - Uniform firmness thanks to continuously adjustable internal pressure
- Long-term availability through cooperation with a renowned specialist ball manufacturer

The new cycle ball was developed in collaboration with a major German manufacturer of special balls. The manufacturing method is comparable to that of many other balls used in indoor sports, this ensuring high long-term availability.

We plan to produce an initial batch of balls in the near future, which we will offer to interested clubs, associations, and players at an attractive

introductory price of €99 plus shipping.
